Leanne Venier  
Austin, Texas 78704

Dear Ms Venier:

I was fortunate to hear your lecture on color and light frequencies used as medical therapy last month at the UT Medical Library in San Antonio. This is a fascinating topic that I had no knowledge of until I heard you speak. I was impressed with the documented data you presented. I was familiar with the lasers you mentioned because I've used them in surgery for several years. I was likewise impressed with Dr. John Ott's observations concerning school children exposed to full spectrum light as opposed to fluorescent bulbs. And I was fascinated by the Kyoto University's Institute of Technology's work on biophoto emissions reported in PlosoNE, 22 July 2009.

As a typical traditional surgeon, I know little about alternative treatments of any kind. I actually did not realize that newborns with jaundice are treated with blue light. It seems ironic that such a simple procedure could have such dramatic results. If physicians will accept that treatment, why won't they be open to managing other problems with light? But that is a recurring problem with many physicians. They simply do not keep an open mind to new or different ideas. As an innovator, I've found it difficult to bring certain new products to market. There is a steep learning curve for most physicians.

I congratulate you for your efforts to enlighten the medical profession. You've certainly enlightened me.

Sincerely,

Michael E. Glasscock III M.D. F.A.C.S.
